

# New Year, Old Threats: What Does the DNS Reveal about 2025?

## Table of Contents

1. [Executive Report](#)
2. [Appendix: Sample Artifacts](#)

## Executive Report

2025 is barely a few weeks old, but we've already heard reports of [advanced phishing attacks](#) leveraging generative artificial intelligence (AI). It's scary but not exactly surprising. Threat actors are expectedly using more sophisticated and modern attack techniques and will likely continue to rely on domain names as phishing vehicles.

With that in mind, the WhoisXML API researchers sought to find out what domain threats the new year literally holds by studying 1,000 suspicious domains that contained the text string **2025** and were recently added to [First Watch Malicious Domains Data Feed](#).

Our in-depth DNS investigation led to the discovery of:

- 401 email-connected domains, one of which turned out malicious
- 877 IP addresses, 311 of which turned out to be malicious
- 4,808 IP-connected domains, one of which turned out malicious
- 10,000 string-connected subdomains

## What We Know about the 2025 Domains

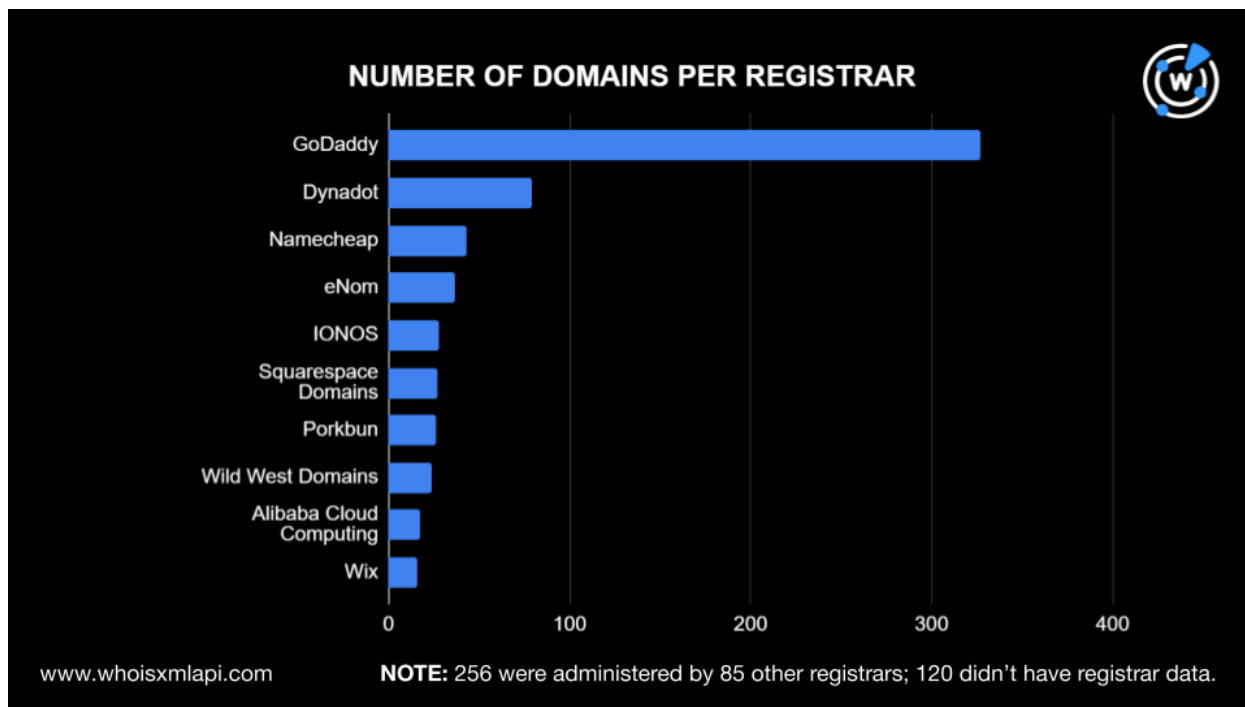

We began our investigation into the 2025-themed domain threats by looking into a sample of 1,000 suspicious domains containing the string **2025**.

After querying them on [Bulk WHOIS Lookup](#), we found that only 880 had current WHOIS records. Here are some of our specific findings.

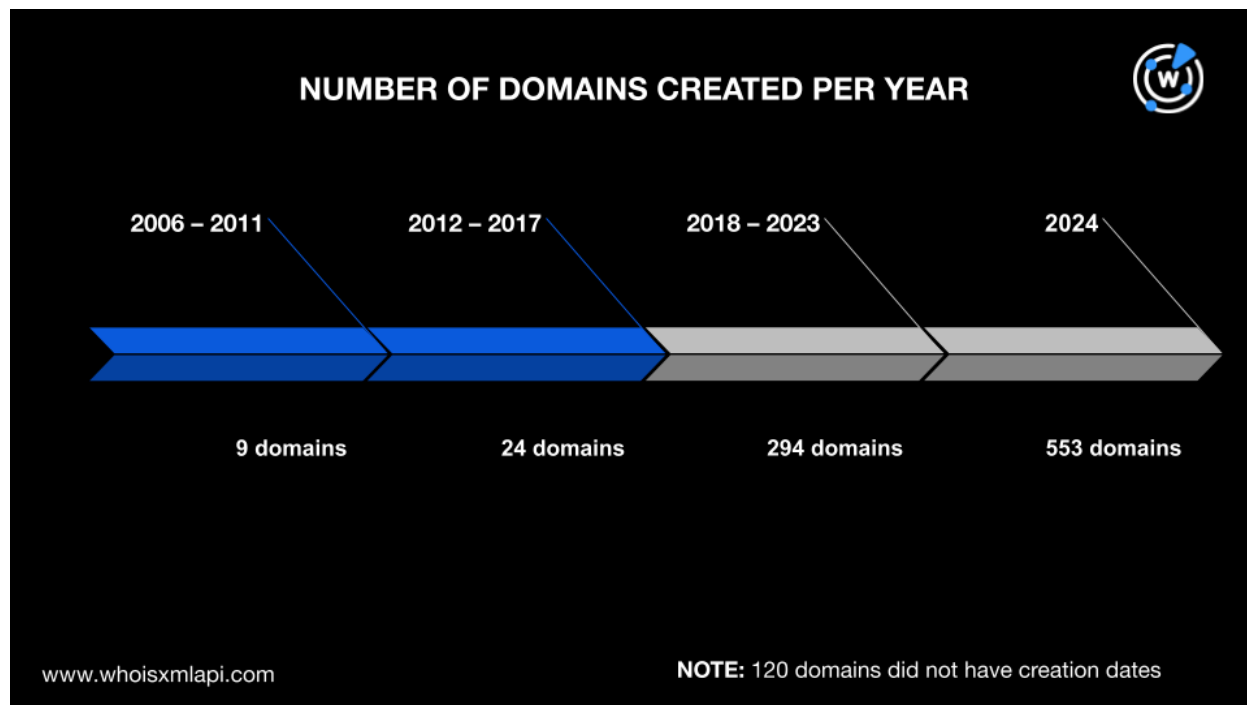

- The domains were administered by 95 different registrars led by GoDaddy, which accounted for 327 domains. The other leading registrars were Dynadot with 79 domains; Namecheap with 43; eNom with 37; IONOS with 28; Squarespace Domains

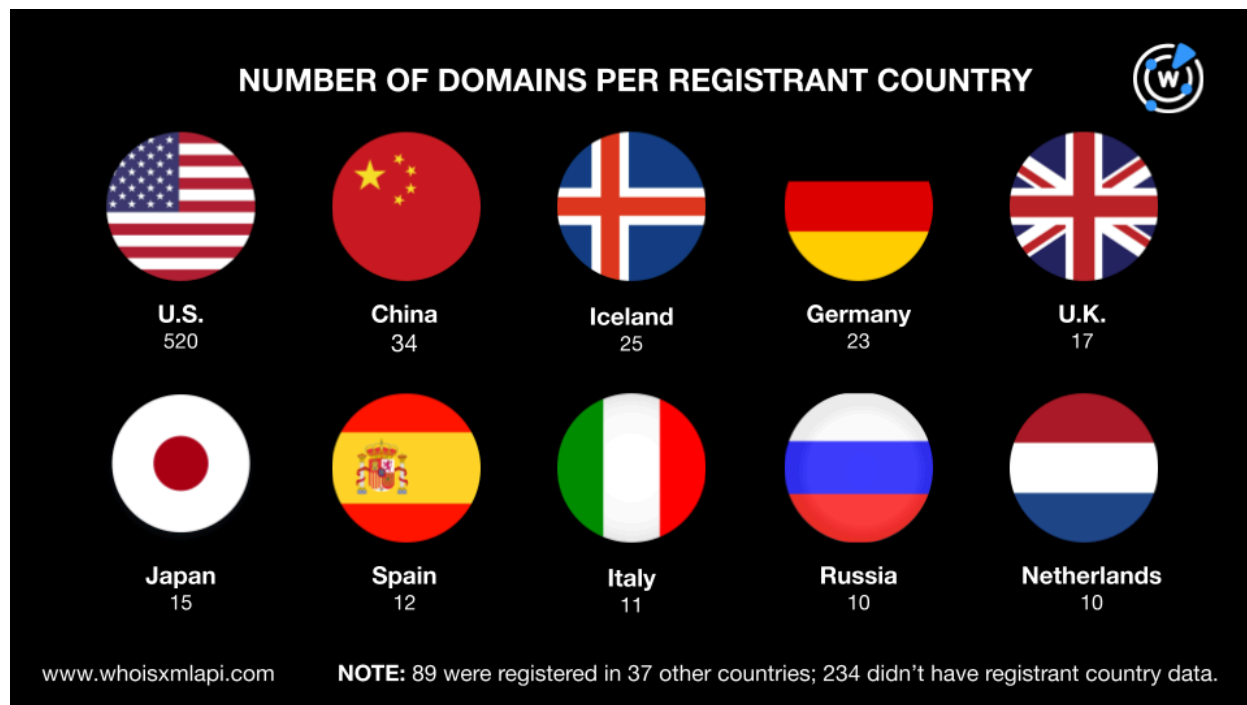

with 27; Porkbun with 26; Wild West Domains with 24; Alibaba Cloud Computing with 17; and Wix with 16. A total of 256 domains were distributed among 85 other registrars, while 120 domains did not have current registrar information.

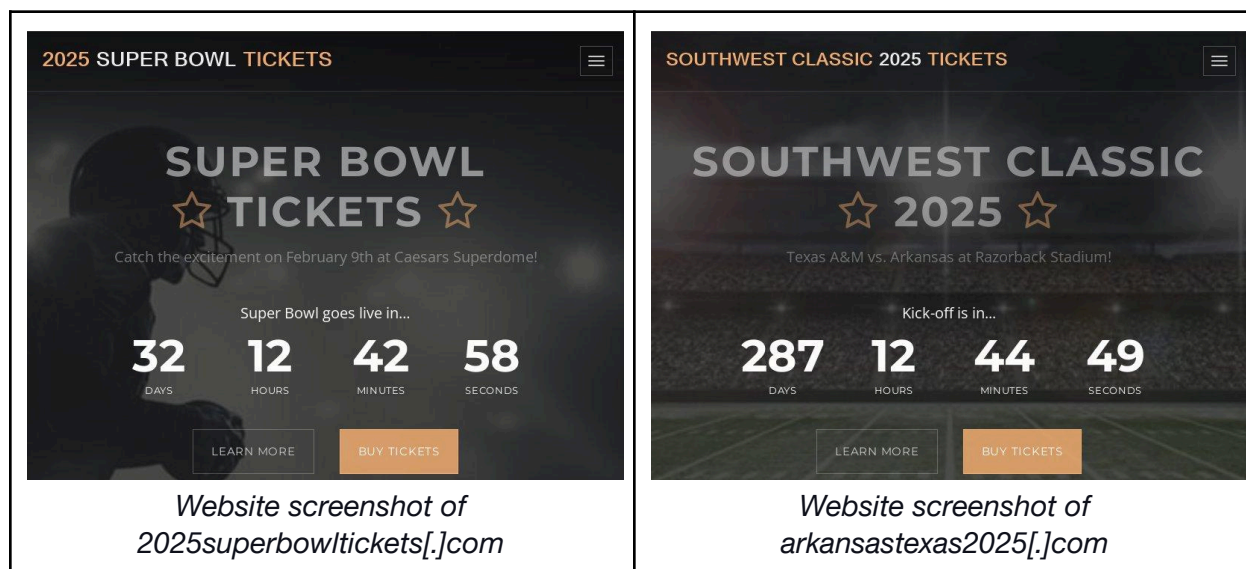

- They were created between 2006 and 2024, although about more than half—553 domains to be exact—were created in 2024.

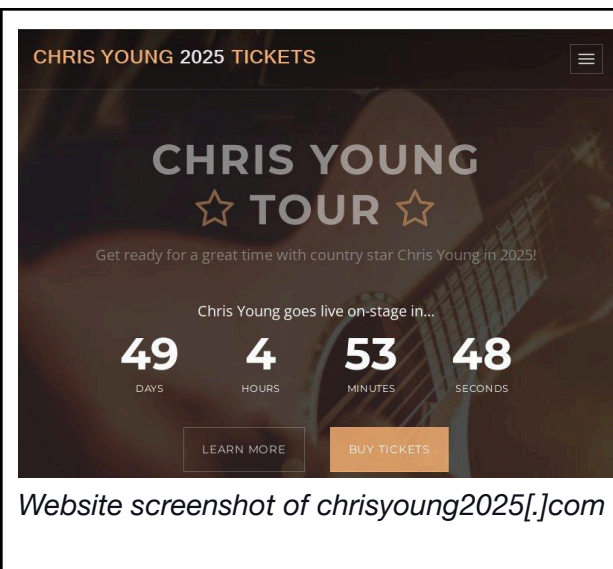

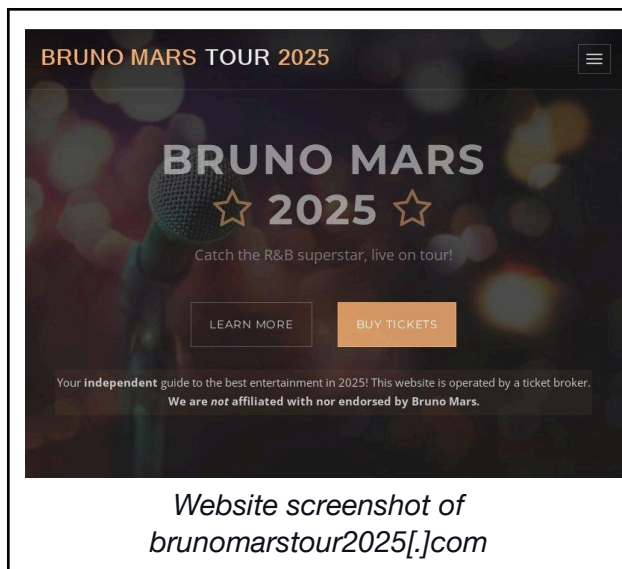

- They were registered in 47 different countries, with the U.S. accounting for 520 domains. The rest of the top 10 registrant countries followed far behind, including China with 34 domains, Iceland with 25, Germany with 23, the U.K. with 17, Japan with 15, Spain with 12, Italy with 11, Russia with 10, and the Netherlands with 10. A total of 89 domains were registered in 37 other countries, while 234 did not have current registrant country data.

We then queried the 1,000 **2025** domains on [Screenshot API](#) and found that 711 hosted or redirected to parked pages or live content. Many of the live domains hosted similar-looking content that sold concert or game tickets. We provided a few examples below.

We also queried the domains on [DNS Chronicle API](#) and found that 937 had 1–218 historical IP resolutions per domain. The domains had a total of 22,315 recorded events from 4 October 2019 to 2 January 2025. Take a look at five examples below.

DOMAIN	START DATE	LAST DATE	NUMBER OF IP RESOLUTIONS
ainiaiwo2025[.]com	4 October 2019	9 November 2024	40
gagatour2025[.]com	6 November 2022	30 August 2024	54
vegaskickoffclassic2025[.]com	13 December 2023	21 December 2024	42
www222025[.]com	29 December 2023	1 January 2025	11
theelection2025[.]com	3 March 2024	9 November 2024	16

## Uncovering 2025 Domain Connections

Having scrutinized the sample of 1,000 **2025** domains aided by domain and DNS intelligence, we dove deeper to look for potentially connected artifacts.

Our bulk WHOIS lookup earlier provided 88 email addresses after duplicates were filtered out, six of which turned out to be public addresses. A [Reverse WHOIS API](#) query for the six public email addresses revealed that three could be owned by a domainer as they were used to register more than 300 domains each.

As a result, we were left with three high-confidence public email addresses that appeared in the WHOIS records of 401 email-connected domains after duplicates and the original domains from First Watch Malicious Domains Data Feed were removed.

We then queried the 1,000 **2025** domains on [DNS Lookup API](#) and found that they currently resolved to 877 unique IP addresses. A [Threat Intelligence API](#) query for the 877 IP addresses revealed that 311 have already figured in various malicious activities. Some examples are shown below.

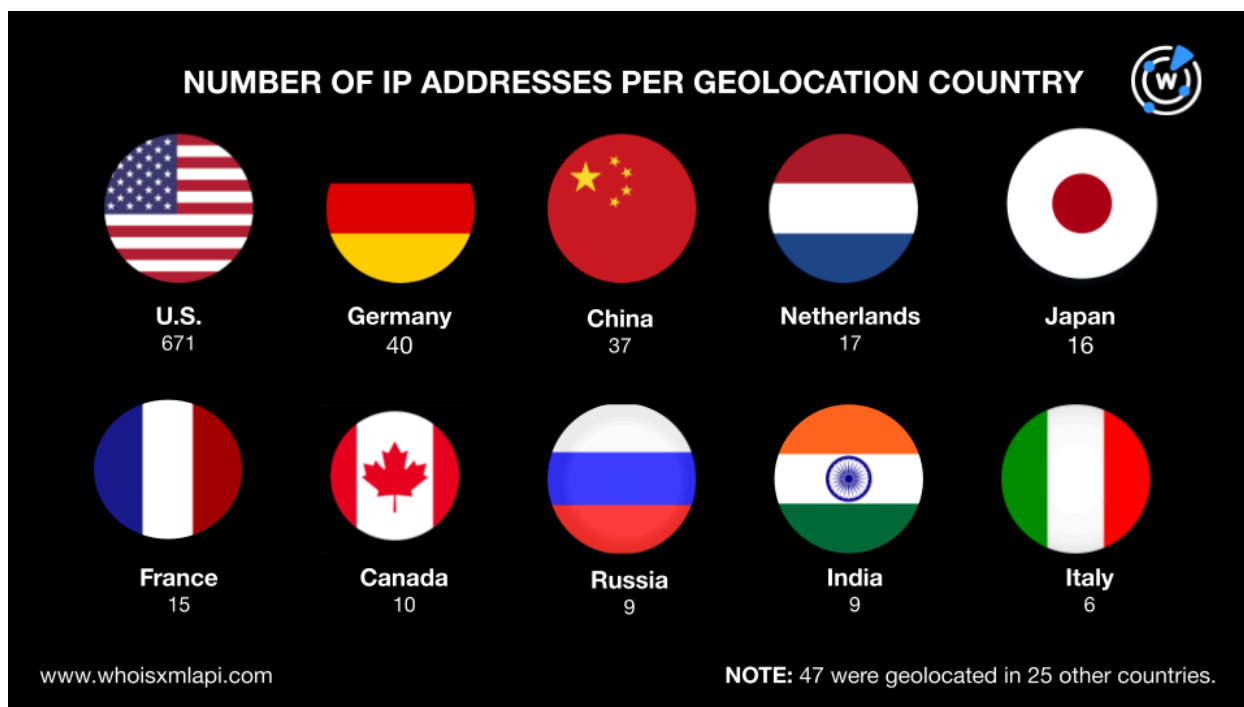

MALICIOUS IP ADDRESS	ASSOCIATED THREATS
162[.]255[.]119[.]164	Generic Malware Phishing
46[.]8[.]9[.]145	Attack Command and control (C&C) Generic Malware Phishing Suspicious
151[.]101[.]1[.]91	Generic Malware Phishing
151[.]101[.]193[.]91	Generic Malware Phishing
99[.]83[.]190[.]102	Attack C&C Generic Malware Phishing Suspicious

We turned to [Bulk IP Geolocation Lookup](#) to learn more about the IP addresses, which revealed that:

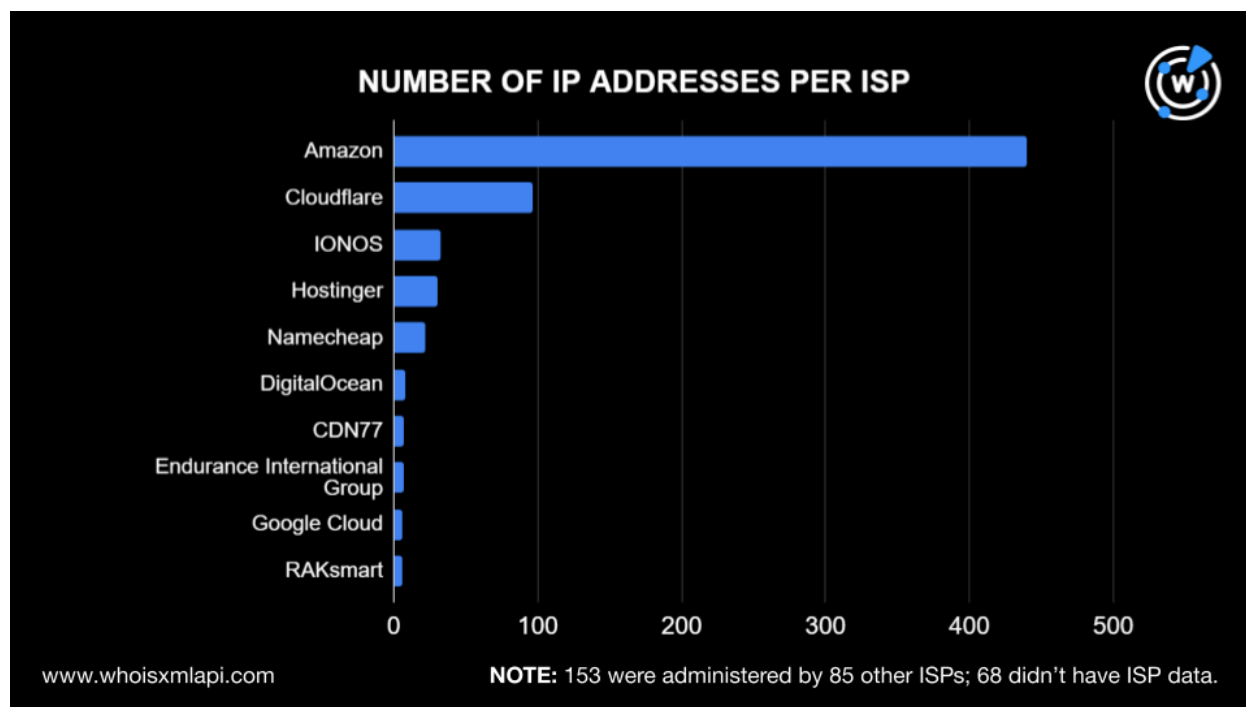

- They were geolocated in 35 different countries led by the U.S., which accounted for 671 IP addresses, followed by Germany with 40 IP addresses. The other top geolocation countries were China (37 IP addresses), the Netherlands (17 IP addresses), Japan (16 IP addresses), France (15 IP addresses), Canada (10 IP addresses), Russia (9 IP

addresses), India (9 IP addresses), and Italy (6 IP addresses). A total of 47 IP addresses were distributed across 25 other countries.

- The IP addresses were managed by 95 different ISPs led by Amazon with 440 IP addresses. It was followed by Cloudflare with 97 IP addresses, IONOS with 33, Hostinger with 30, Namecheap with 22, DigitalOcean with eight, CDN77 with seven, Endurance International Group with seven, Google Cloud with six, and RAKsmart with six. A total of 153 IP addresses were spread across 85 other ISPs, while 68 did not have ISP data.

Our next step was to query the 877 IP addresses on [Reverse IP API](#) to find IP-connected domains. We found that 78 of them could be dedicated hosts, which accounted for 4,808 IP-connected domains after duplicates, the original domains, and the email-connected domains were filtered out.

For one, a Threat Intelligence API query for the 4,808 IP-connected domains revealed that cp80[.]nsixo[.]com has already figured in cyber attacks.

As our final step, we used [Domains & Subdomains Discovery](#) to look for subdomains containing the text string **2025**. We limited our searches to those that were added from 1 to 5 January 2025 and discovered 10,000 string-connected subdomains.

—

Our investigation into riding on the new year began with a sample of 1,000 suspicious 2025-themed domains. That led to the discovery of 16,086 threat artifacts comprising 401 email-connected domains, 877 IP addresses, 4,808 IP-connected domains, 10,000 **2025**-themed newly added subdomains. By the end of our investigation, we found that 313 of these artifacts have already figured in different malicious activities.

***If you wish to learn more about the products used in this research, please don't hesitate to [contact us](#).***

**Disclaimer:** We take a cautionary stance toward threat detection and aim to provide relevant information to help protect against potential dangers. Consequently, it is possible that some entities identified as “threats” or “malicious” may eventually be deemed harmless upon further investigation or changes in context. We strongly recommend conducting supplementary investigations to corroborate the information provided herein.
